Finding an Embedding for Music Auto-Complete: An LSTM Approach

Nathaniel Patterson
Advisor: Dr. Rodney Summerscales

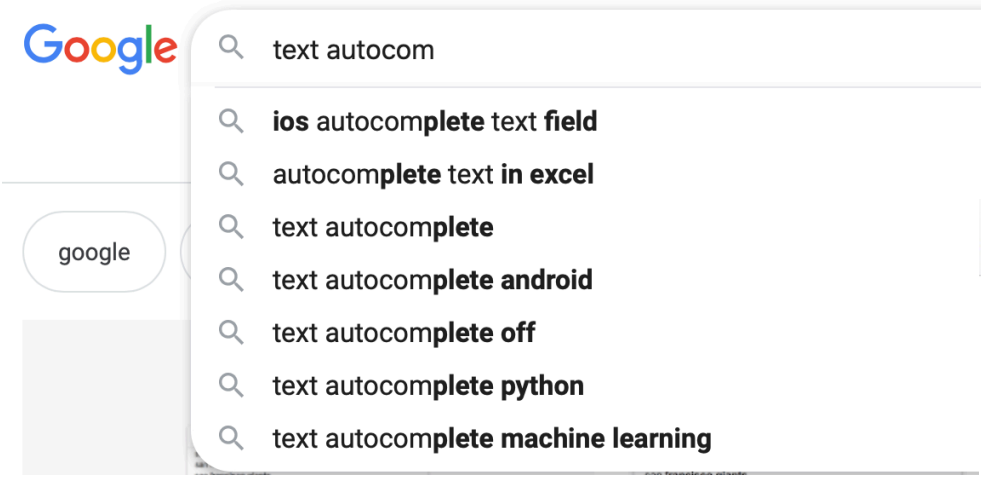
Department of Computing
School of Business Administration, Andrews University

J.N. Andrews Honors Program
Andrews University

Statement of Research Goals

- Introduce Music Autocomplete as a new problem
- Explore two embedding strategies using a Long Short Term Memory Recurrent Neural Network
- Provide commentary on the philosophical consideration of computer generated art and the ”predictability” of an artist

Understanding Autocomplete

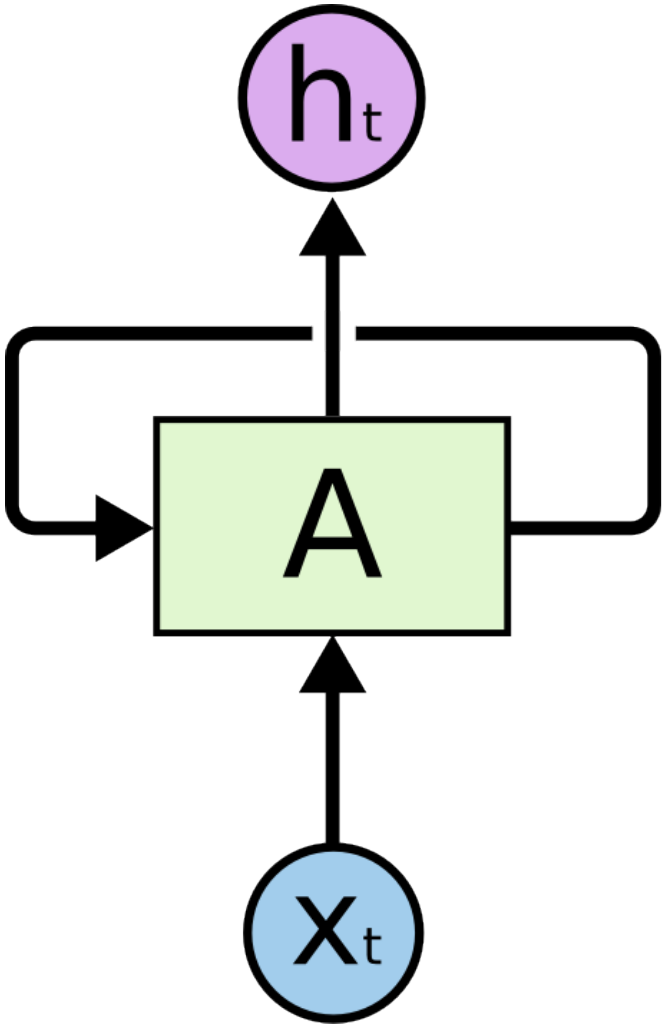


Background Music Autocomplete

- Polyphonic music generation using “Bi-Axial” LSTM (Johnson 2017)
- “Bachbot” was user tested to discriminate between Bach compositions and generated compositions (Liang, et al 2017)
- Text autocomplete is well-developed:
  - Story Scrambler (Pawade, et al 2018) focused on LSTM architecture and evaluated generated text stories when trained on books in the public domain
  - Many other models and embeddings have seen great success in research and industry applications

Background Music Autocomplete

- New Problem
- Similar to:
  - Music Generation
  - Text Autocomplete
- LSTM-RNN (Hochreiter 1997) approach provides a good baseline

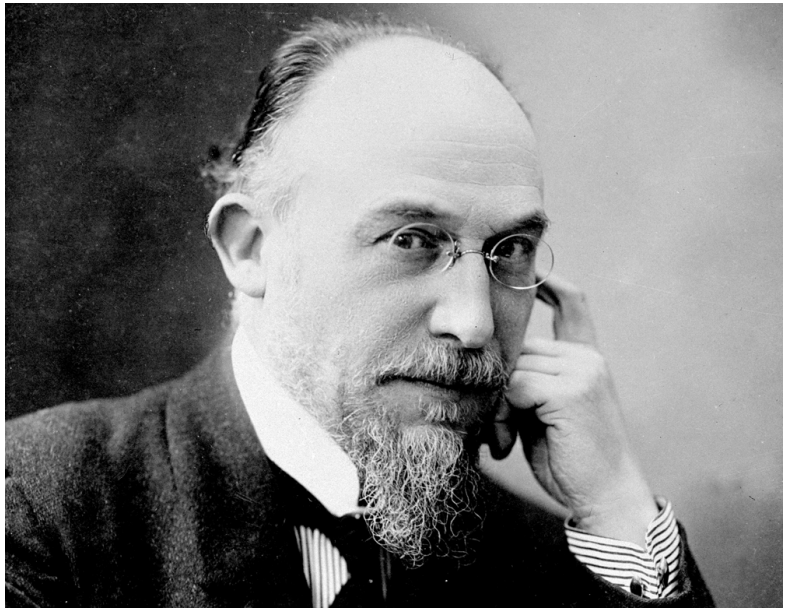


Methodology

- Select Artist
- Gather Data
- Prepare Data
- Build Model
- Train the Model
- Evaluate the Model

Note on Erik Satie

- Lived 1866-1925, France
- Witty, Satirical style in league with Surrealist Movement
- Music characterized by a refusal to be involved in any degree of transcendent significance, while disregarding traditional tonal norms
  - *Trois morceaux en forme de poire (1903)*
  - *Sports et divertissements (1914)*
- We recognized 157 piano compositions



Data

- Data is formatted as Musical Instrument Digital Interface (MIDI) files
- Classical music is in the Public Domain
- We were able to locate MIDI files for roughly 48% (76) of the 157 piano compositions
  - Some compositions of shorter length were combined with other movements. Total file count was 49 MIDI files
- Music21 Python library used to translate between MIDI and string

Data Representation

- All songs in training set are embedded as a string of notes with spaces separating each timestep

```
'A4 C5 F#5F#4 E5D5E4 F#5F#4 G5B4G4 G4 A4 D5D4 C5B4C4 D5D4 E5G4E4 G4 G4F#4G1G2 E4 B4D4A1A2 A4 C

```

- Every note or chord played at a timestep regardless of note stem or clef is considered one chord for our purposes

Data Representation

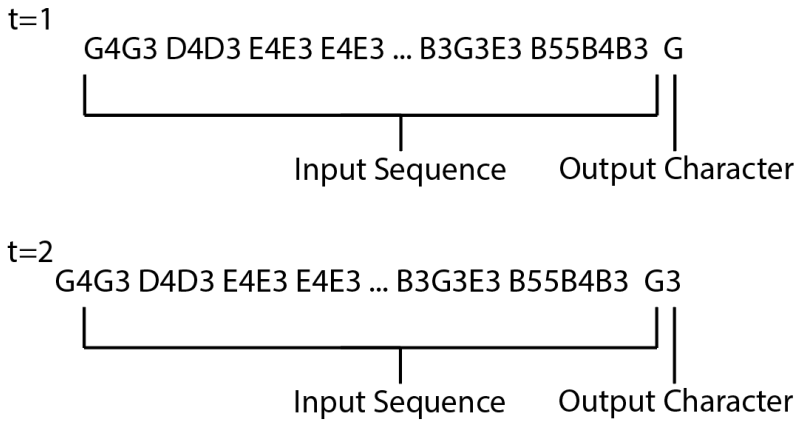
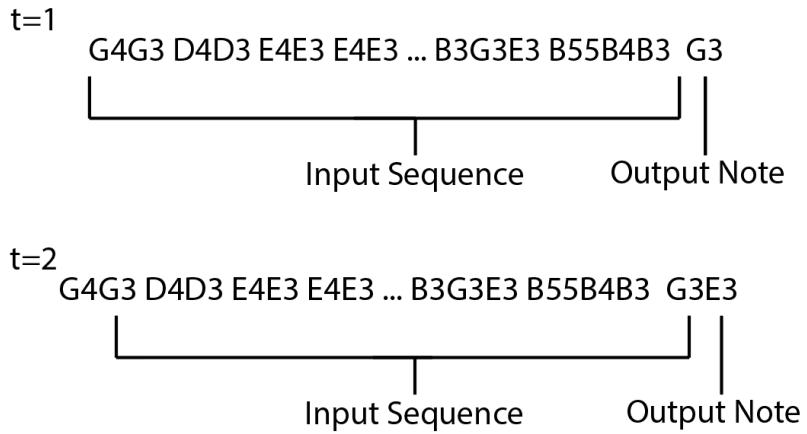
C#4C#3 B3B2 A2A3 B2B3 G#2G#3 A2A3…

Character strategy:



Note Strategy:



Data Embeddings

- Test two different embedding strategies
- Notes as Characters and Notes as Objects
- Both take a string approach with timesteps separated by space characters

```

 'E': 16,
 'F': 17,
 'G': 18}
```

Training Process

- Data split into Training and Testing files 80/20
- Training files were split into training and validation sets
- Loss over validation set was tracked to avoid overfitting
- Process repeated three times and results averaged

Model Evaluation: Char-LSTM

- Over each independent trial we saw a <20% success rate.
- Success was determined by whether or not the true note occurred in the top five suggestions list from the data.
- Example output:

Model Evaluation: Note-LSTM

- Results not reportable
  - Embedding strategy was not well suited for an LSTM
- Too little data and too many notes
- String representation overfitted to space characters

```
count=0
for item in objectsNum:
  if item == 0:
    count+=1
count/len(objectsNum)
```

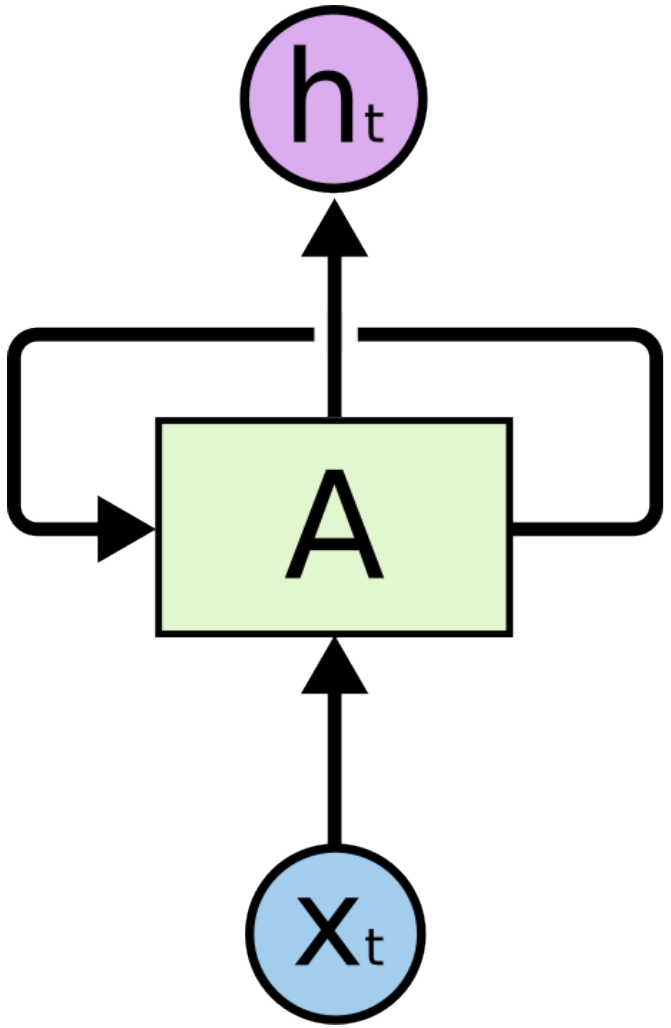
```
0.3194008502522945
```

Discussion

- Saw interesting results with the Character based model with a <20% success rate over three trials
- Important to let embeddings drive model choice
- Is it fair to assume a model could learn an artist’s style solely on his/her works?
- Would the LSTM model do better if trained on every Satie piece?

What is a good prediction?

- Should more attention be given to how we determine success?
- Is it fair to penalize just because it didn't get the exact chord or note?
- Other metrics



Future Work

- A non-string approach that used an 88-length vector for each timestep with a 1 for each note played using another model architecture should be explored
- Attempting with other artists
- Develop a good Network Architecture for this problem
  - RBM?
  - LSTM?
  - GAN?
- Determine a good metric for analyzing results. What is fair to the model?
- Interdisciplinary work

Acknowledgements

- Special thank you to the Honors Program and Department of computing for their support in conducting this research and presenting in the COVID-19 era.
- Special thanks to Dr. Summerscales for his advice and assistance
- Special thank you to Musicalion for free use of their MIDI library for research purposes

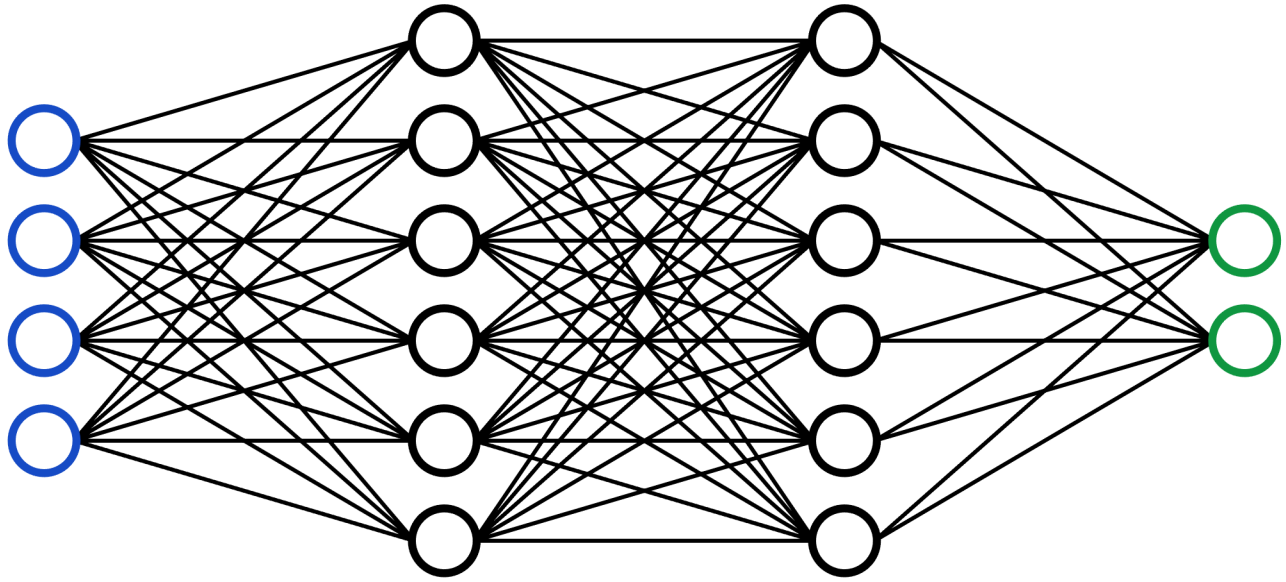
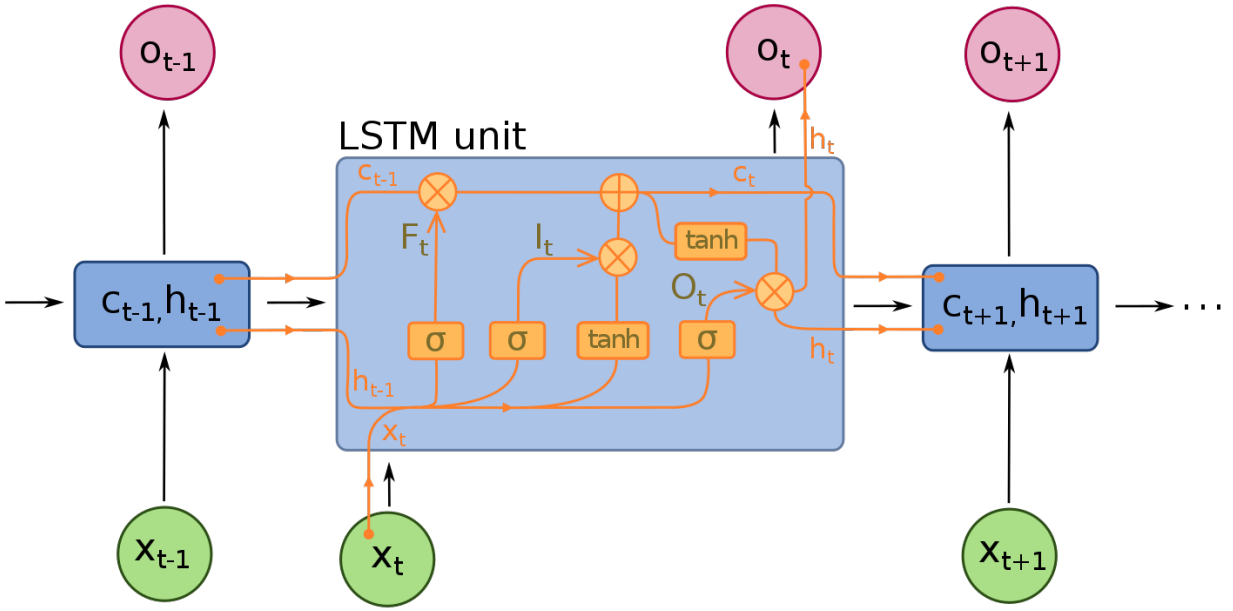
Neural Networks

- Goal: learn a function that maps input to a given output
- Different architectures better suited to different problems
- Recurrent Neural Network (RNN) architecture suited to sequential data



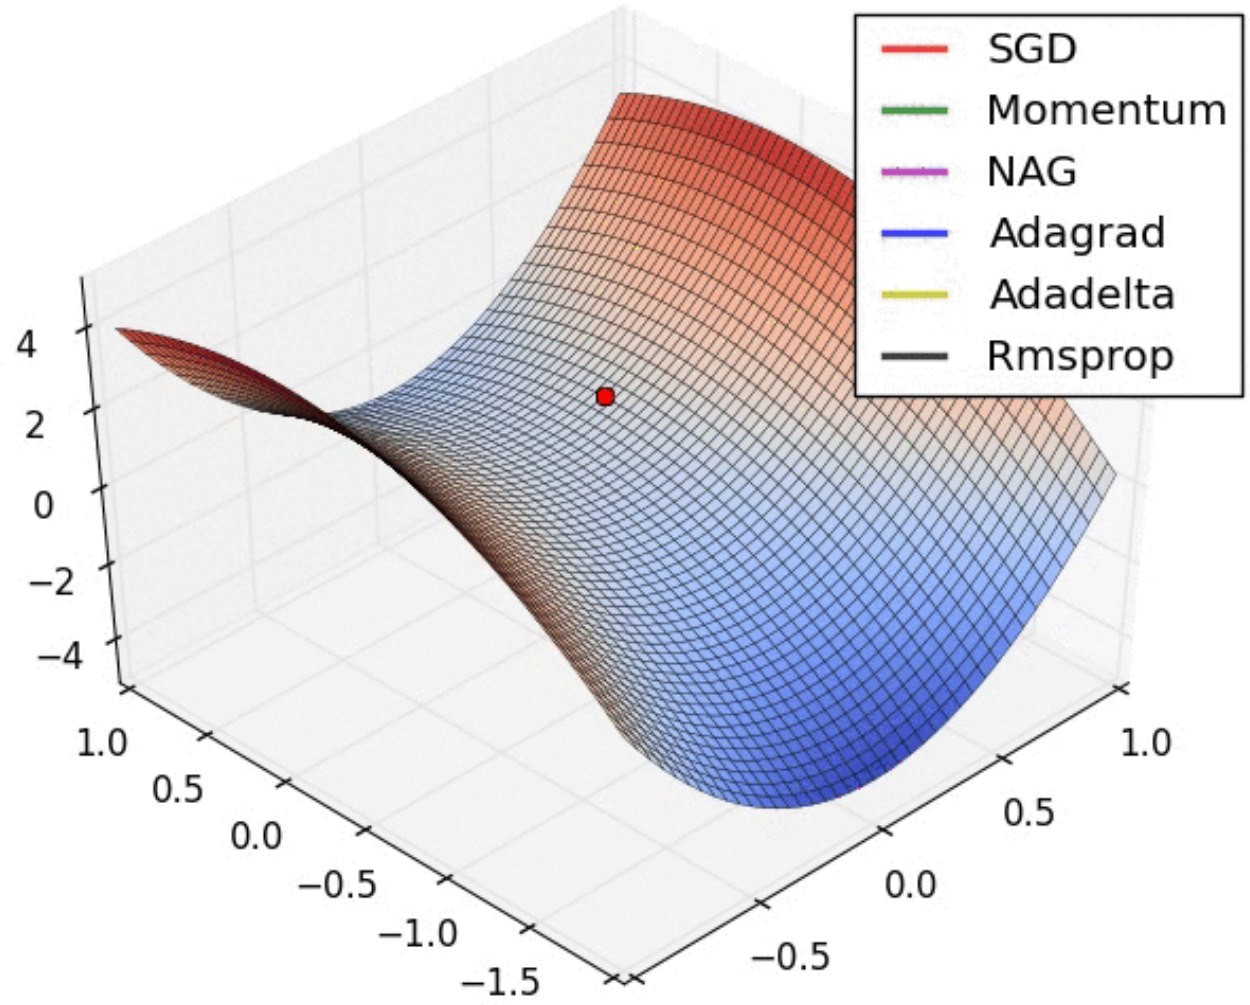
Note on Long-Short Term Memory RNN

- LSTM-RNN solved the issue of "Long-Term Dependencies"
- Neural Network for modeling sequential data
- Along with learning function, also learns what values to keep and forget



How do models learn?

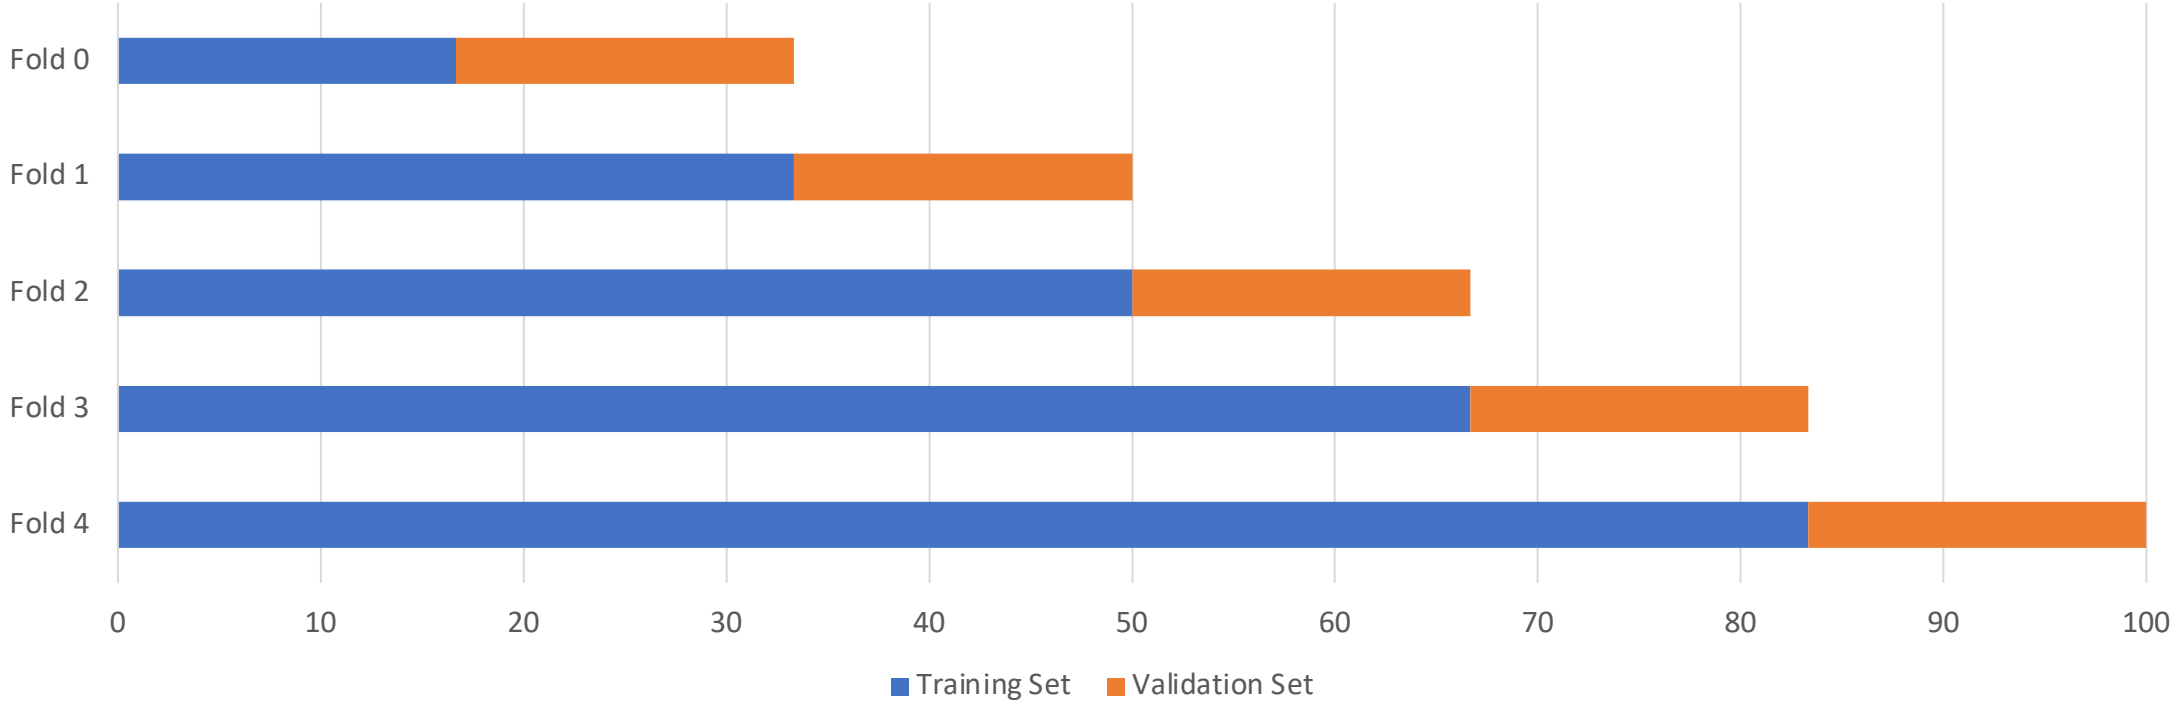
- Optimization
- Gradient Descent
- Optimize on loss taken over predicted values



https://ruder.io/content/images/2016/09/saddle_point_evaluation_optimizers.gif

Time Series Split

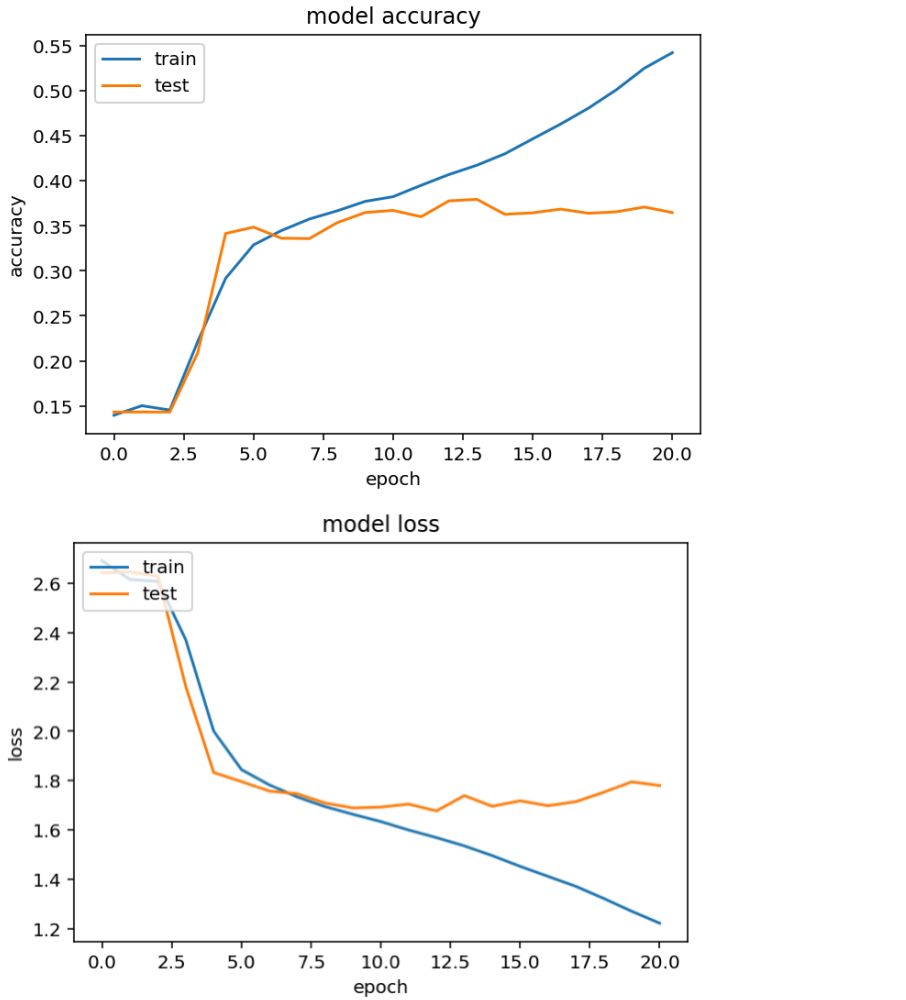
- 40 training values tracked over 5 different folds to see where overfitting happens and validation loss stops improving
- Once proper number of epochs are decided, then we train on 100 percent of the data



Note on model training

- Find where Accuracy stops increasing and Loss stops decreasing
- Over each trial we found the average overfitting point was at ~8 epochs

```
dict_keys(['loss', 'accuracy', 'val_loss', 'val_accuracy'])
```



Model Architecture

```

The simple LSTM-RNN model used consists of three LSTM layers with dropout 0.3 and 512, 256, and 256 nodes per layer respectively and two dense layers one with 256 nodes and the other with node count equal to the length of the output vector.

Model Evaluation: Char-LSTM

- Model Training over three independent trials
